

Summary of What I learned

Here are a few things I learned from reading the material. The first thing I found interesting is that inheritance can be integrated with HTML. Previously I thought inheritance wasn't possible with HTML so that was interesting to find out. Next, I didn't realize how much JavaScript was used in conjunction with HTML/CSS. It makes sense now that I understand more about how it works but that was something new to me as well. I also found the layout of a style sheet cool. How the window is divided. How padding is done. It makes it simple to understand. One thing I will say I do not like about what I have learned so far is how tedious this process can be. There are numerous ways to create a website without ever having to type a line of code. Having said that, I can see why learning HTML and CSS can be useful. It introduces new programmers into a way of thinking that is necessary for all programmers. You aren't always going to get the answer on the first try. Sometimes you need to solve a little part of a bigger problem instead of trying to solve the big problem all at once! These are just a few of the many things I learned with these readings
